# Outline

---

- Respiratory physiology during sleep and chronic hypercapnic respiratory failure
- Positive airway pressure therapy and non-invasive ventilation (NIV).
- Sleep Disordered Breathing (SDB) and chronic hypercapnic respiratory failure; use of NIV in special patient populations:
  - Obesity Hypoventilation Syndrome (OHS).
  - Neuromuscular disease (NMD).
  - Stable hypercapnic COPD.

Walter T. McNicholas, MD, FCCP. CHEST 2017; 152(6):1318-1326

# Respiratory changes during Sleep

---

- ↓ in minute ventilation 0.5-1.5 L
  - ↓ in metabolic rate (CO<sub>2</sub>) production 10-15%
  - ↓ in hypoxic and hypercapnic ventilatory response 20-30%
  - ↓ PaO<sub>2</sub> 3-10 mmHg
  - ↓ SaO<sub>2</sub> 2%
  
  - ↑ in upper airway resistance
  - ↑ PaCO<sub>2</sub> 2-8 mmHg
-

HARVARD MEDICAL SCHOOL

# Respiratory Assist Devices (RADs) (E0470/E0471)

PAP Mode	Settings/Target
BPAP BPAP-ST, with back up rate (BR)	IPAP, EPAP Pressure support = IPAP-EPAP BR = Spontaneous timed (ST) or timed (T)
Adaptive Servo Ventilation (ASV)	Pressure support varies to stabilize breathing pattern (PS min, PS max) EPAP varies to eliminate airway obstruction (EPAP min, EPAP max)
Volume-assured Pressure Support AVAPS or iVAPS	Pressure support varies to meet a target tidal volume or alveolar ventilation EPAP set to eliminate airway obstruction Set a back up rate 2 breaths < spontaneous RR

# Benefits of VAPS

- REM/NREM variation in ventilation
- Positional variation in ventilation
- Fluid shifts/changes in lung compliance seen in OHS
- Progression of disease seen in ALS
- Intermittent exacerbations seen in COPD

# Non-Invasive Ventilation

Respiratory Assist Devices (RAD) (E0470/E0471)	Home mechanical ventilation (HMV) (E0465/E0466)
Bi-level devices with or without back up respiratory rate capability	Life supporting/sustaining devices
BIPAP-S (E0470) BIPAP-ST/ASV/VAPS (E0471)	Invasive: trach (E0465), Non-invasive: (E0466) Trilogy, Astral
Limited settings	At least 6 pressure modes and 3 volume modes
External batteries optional	Internal (6-18 hours) and external batteries
Only oronasal masks	Can switch between a mouthpiece and oronasal mask
Limited alarms	More sophisticated monitoring and alarm system

# OHS Phenotypes

---

## ➤ Obstructive:

- 90% of patients with OHS have OSA (AHI  $\geq$ 5/hr).
- 70% of patients have concomitant severe OSA (AHI  $\geq$ 30/hr)

## ➤ Non-obstructive:

- 10% have non-obstructive sleep hypoventilation (etPCO<sub>2</sub> or tcPCO<sub>2</sub> >55 mmHg for >10 min or an increase >10 mmHg compared to awake PaCO<sub>2</sub> to a value >50 mmHg for >10 min)

Masa et al. Eur Respir Rev 2019

# Question #1

---

A 57 year old man, with a BMI of 45 kg/m<sup>2</sup>, admitted with pneumonia, and acute on chronic hypercapnia. Admission PaCO<sub>2</sub> was 75 mmHg, with a pH 7.25 and HCO<sub>3</sub> 34.

Intubated for three days but now extubated and successfully treated with BiPAP 16/8 cmH<sub>2</sub>O only during sleep.

Morning PaCO<sub>2</sub> now 50 mmHg, with a normal pH.

An ABG following a night without NIV showed a PaCO<sub>2</sub> 60.

You are contemplating initiation of home NIV.

The patient is all ready for discharge, what should you do?

Go to [www.menti.com](http://www.menti.com) and use the code 2208 5976

## Question #1

---

- A. Use the patient's diagnosis and ABG results to qualify for NIV, and order an outpatient attended PSG in 2-3 months.
- B. Keep the patient one more night and get a portable sleep study off NIV.
- C. Keep the patient one more night and obtain bedside Spirometry.
- D. Discharge the patient without NIV and obtain a PSG as soon as you can.

Go to [www.menti.com](http://www.menti.com) and use the code 2208 5976

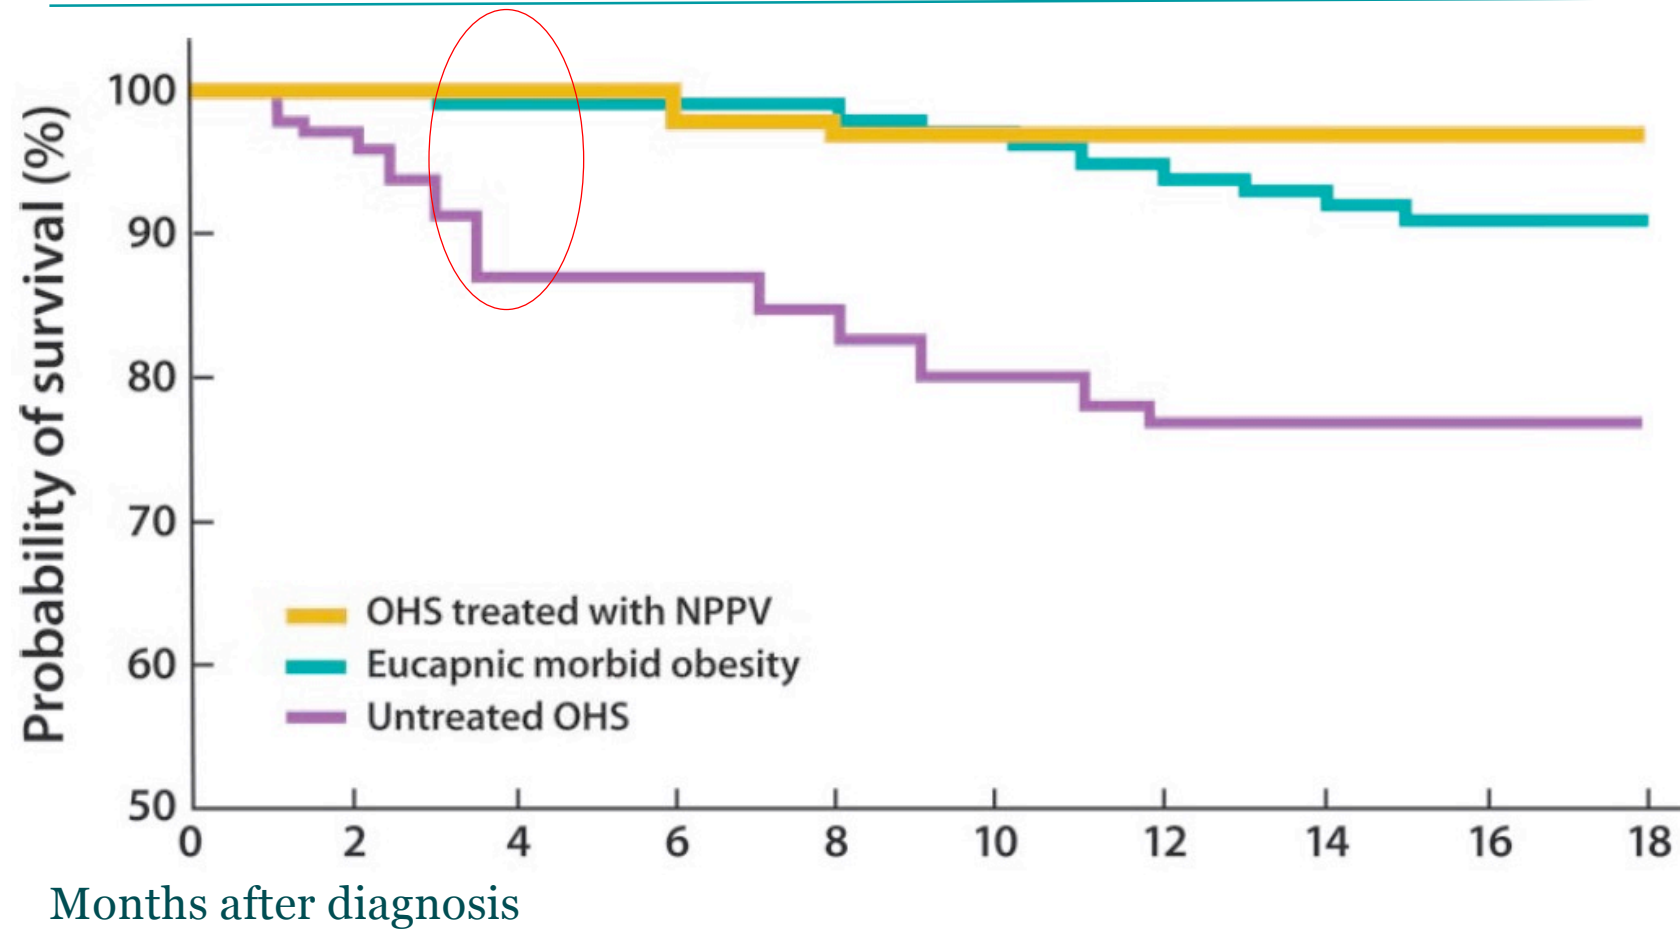

# Question #1

---

- A. Use the patient's diagnosis and ABG results to qualify for NIV, and order an outpatient attended PSG in 2-3 months.  
(patient already meets criteria for OHS)
- B. Keep the patient one more night and get a portable sleep study off NIV
- C. Keep the patient one more night and obtain bedside Spirometry.
- D. Discharge the patient without NIV and obtain a PSG as soon as you can.

## Benefit of Initiation upon discharge

Nowbar S, et al., Am J Med 2004;116:1–7. Budweiser et al. J Intern Med 2007;261:375–383

Mokhlesi et al. ATS Clinical Practice Guideline. AJRCCM Vol 200, Iss 3, pp e6–e24, Aug 1, 2019

# Qualifying Criteria

---

- BIPAP-S
  - Awake ABG PaCO<sub>2</sub> ≥45 mm Hg on prescribed FIO<sub>2</sub>, AND
  - COPD has been considered and ruled out, AND
  - ABG on awakening with PaCO<sub>2</sub> ≥7 from baseline, OR
  - PSG or HST demonstrates desaturation ≤ 88% for ≥ 5 minutes of recording not due to obstruction (AHI < 5)
- BIPAP-ST/VAPS
  - Despite BIPAP-S use, AGB on awakening with PaCO<sub>2</sub> ≥7 mmHg from qualifying PaCO<sub>2</sub>, OR
  - PSG or HST on BIPAP-S demonstrates desaturation ≤ 88% without OSA
- HMV
  - Persistent Hypercapnia or need for higher IPAP >25 CMW
  - Significant dyssynchrony (longer insp time, higher EPAP, adjust rise time)
  - Need for daytime support (>10 hrs)

# Neuromuscular Disease (NMD)

BRIGHAM AND

29

HARVARD  
MEDICAL SCHOOL

29

# Neuromuscular Disease

---

## Brain/Spinal Cord

- Multiple Sclerosis (transient, migratory)
- Trauma (permanent)

## Motor Neuron

- Post-polio syndrome (very slowly progressive)
- Amyotrophic lateral sclerosis (rapidly progressive)
- Spinal muscular atrophy (progressive)

## Motor Nerves

- Charcot-Marie-Tooth disease (very slowly progressive)
- Diaphragm paralysis (slowly reversible)

## Neuromuscular Junction

- Myasthenia gravis (reversible)

## Muscle

- Duchenne muscular dystrophy (slowly progressive)
- Myotonic dystrophy (progressive)
- Metabolic: acid maltase deficiency (slowly progressive)

# Neuromuscular Disease and respiratory pathophysiology

Aboussouan et al. AJRCCM Vol 191, Iss 9, pp 979–989, May 1, 2015

## Question # 2

---

Nocturnal desaturation in patients with NMD occurs due to (choose A-D):

- A. Worsening Hypoventilation
- B. Periodic apneas and hypopneas
- C. Ventilation/perfusion mismatch
- D. All the above

Go to [www.menti.com](http://www.menti.com) and use the code 2208 5976

## Answer # 2

---

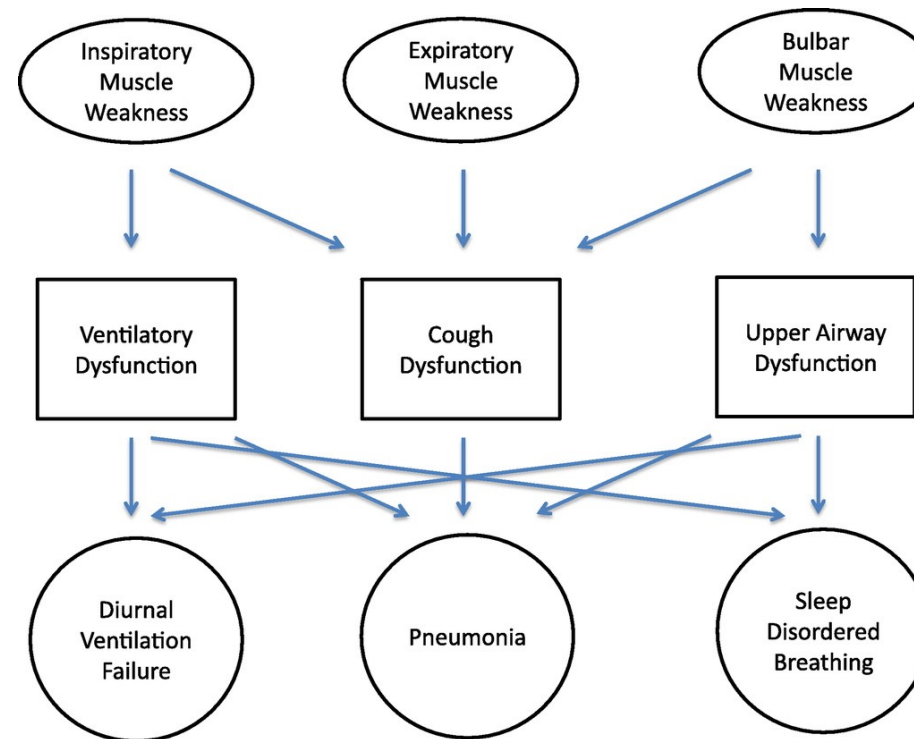

Nocturnal desaturation in patients with NMD occurs due to (choose A-D):

- A. Worsening Hypoventilation
- B. Periodic apneas and hypopneas
- C. Ventilation/perfusion mismatch
- D. All the above

(multiple mechanisms, overnight oximetry might not explain the whole picture)

# Neuromuscular Disease and respiratory pathophysiology

# Diaphragmatic Events

Bourke et al. Eur Respir J 2002; 19: 1194–1201

# Survival Benefit of NIV in ALS RCT (N=41)

Survival non-invasive ventilation (blue) compared with standard care (black) in patients with ALS and (a) normal or only moderately impaired bulbar function and (b) severe bulbar impairment.

Bourke et al. *Lancet Neurol.* 2006 Feb; 5(2):140-7.

# Identifying who will benefit from NIV in ALS/MND in a clinical cohort

---

- Retrospective study (N=929)
- Patients who refused NIV were taken into the control group
- The NIV group had a 13 months survival benefit (including patients with poor bulbar function)
- NIV delayed deterioration of respiratory function (FEV1, FVC, MIP/MEP, Sniff nasal insp pressure-SNIP)
- Quality of life questionnaires and Sleep quality questionnaires also showed improvement.

Berlowitz DJ, et al. J Neurol Neurosurg Psychiatry 2016;87:280–286

## Question # 3

---

A 57 year old man with ALS, admitted with pneumonia, acute on chronic hypercapnia.

Admission PaCO<sub>2</sub> was 75 mmHg, pH 7.25 and HCO<sub>3</sub> 34

Intubated for 5 days but now extubated and successfully treated with BiPAP 15/5 cmH<sub>2</sub>O during sleep.

Morning PaCO<sub>2</sub> now is 50 mmHg with a normal pH, and the patient is much more comfortable with more daytime energy.

A bedside spirometry showed an FVC 40% predicted.

You are contemplating sending this patient home on NIV.

The patient is all ready for discharge, what should you do?

Go to [www.menti.com](http://www.menti.com) and use the code 2208 5976

## Question # 3

---

- A. Use the patient's current diagnosis and ABG results to qualify for NIV
- B. Keep the patient one more night and get a portable sleep study off NIV
- C. Discharge the patient without NIV and get the PSG as soon as you can
- D. Obtain an outpatient full PFTs with seated/supine spirometry to qualify for NIV.

Go to [www.menti.com](http://www.menti.com) and use the code 2208 5976

## Question # 3

---

- A. Use the patient's current diagnosis and ABG results to qualify for NIV  
(Patient already meets criteria for initiation of NIV in ALS)
- B. Keep the patient one more night and get a portable sleep study off NIV
- C. Discharge the patient without NIV and get the PSG as soon as you can
- D. Obtain an outpatient full PFTs with seated/supine spirometry to qualify for NIV.

# Qualifying Criteria

---

## BIPAP-S, BIPAP-ST/VAPS:

- Diagnosis of progressive neuromuscular disease, AND
- Awake PaCO<sub>2</sub> > 45 mmHg while on prescribed FiO<sub>2</sub>, OR
- Overnight oximetry shows SaO<sub>2</sub> ≤ 88% for > 5 minutes (minimum recording of 2 hours) on prescribed FIO<sub>2</sub>, OR
- Max inspiratory pressure < - 60 cmH<sub>2</sub>O
- FVC < 50% predicted AND COPD is not contributing to symptoms.

# Initiating NIV

When? Symptoms (orthopnea, daytime sleepiness) Vs. PCO<sub>2</sub> and PFTs

Where? During in-patient admission, outpatient setting or sleep lab

BPAP-ST	VAPS (iVAPs or AVAPS)
<ul style="list-style-type: none"><li>- IPAP: 8-10 cmH<sub>2</sub>O</li><li>- EPAP: 4-5 cmH<sub>2</sub>O</li><li>- BR: 2 below spont RR</li></ul> <ul style="list-style-type: none"><li>- Adjust IPAP by 1-2 cmH<sub>2</sub>O to alleviate dyspnea, decrease RR, and increase tidal volume</li></ul>	<ul style="list-style-type: none"><li>- EPAP: 4-5 cmH<sub>2</sub>O</li><li>- IPAP min: 4-6 cmH<sub>2</sub>O, gradually increase to reach target tidal volume of 8 ml/kg</li><li>- IPAP max: IPAP min + 5-6 cmH<sub>2</sub>O</li><li>- BR: 2 below spont RR</li></ul> <ul style="list-style-type: none"><li>- Adjust trigger sensitivity, rise time, inspiratory time, to alleviate dyspnea and patient comfort</li></ul>

- Follow downloaded data, monitor for symptoms, overnight oximetry/TcCO<sub>2</sub>, VBG or HCO<sub>3</sub>. PSG only if patient can't adapt or you suspect OSA.
- If daytime ventilation becomes necessary, consider mouthpiece ventilation rather than tracheostomy (Switch to HMV if not already initiated)

# High Intensity BIPAP for COPD with Chronic Hypercapnia

Long Term RCT (N = 201): COPD Gold IV ( $\text{PaCO}_2 > 52$  and  $\text{pH} > 7.35$ , stable hypercapnic)

- HI NIV (IPAP 24-28 cmH<sub>2</sub>O with back up rate) aimed to reduce  $\text{PaCO}_2$  to below 48, or >20% from baseline, vs standard of care for the control group (home oxygen)
- Improved 1 year mortality ( $p=0.0004$ )
- Improved  $\text{PaCO}_2$ , pH,  $\text{SaO}_2$ , FEV<sub>1</sub> and HRQOL with HI NIV

Kohnlein, T et al Lancet Respir Med 2014

BRIGHAM AND  
WOMEN'S HOSPITAL

| The Lung Center |

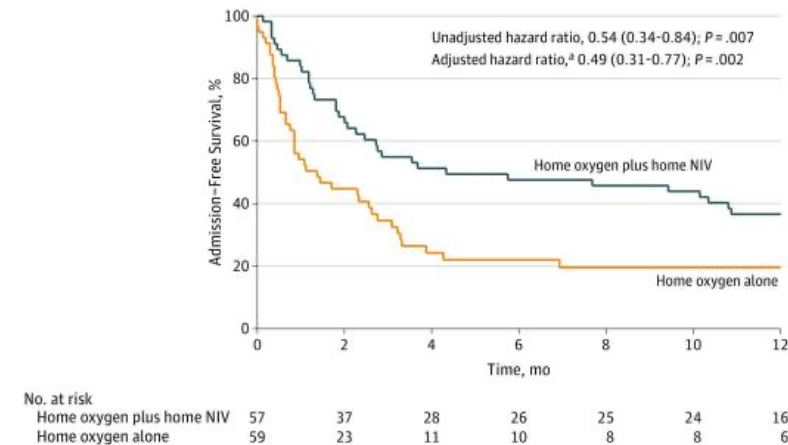

# If Hospitalized-When to Initiate Home NIV?

## – The Home Oxygen Therapy-Home Mechanical Ventilation Trial

HOT-HMV trial (N=116)

- Patients with persistent hypercapnia ( $\text{PaCO}_2 > 52$ ) at 2-4 weeks post discharge were assigned to HOT-HMV or HOT alone.
- Median HMV settings: IPAP 24 cmH<sub>2</sub>O, EPAP 4 cmH<sub>2</sub>O, RR 14/min
- HOT-HMV showed reduction in readmission or death by 50%

- The Rescue trial (N=201)

- Patients with persistent hypercapnia at 48 hrs, assigned to NIV vs standard of care
- At 1 year, NO reduction in mortality or frequency of exacerbations or time to readmission
- Patients recruited right after exacerbation, many did not have persistent hypercapnia

- In the US, assess 2-4 weeks post discharge for a  $\text{PaCO}_2 > 52$ , and if present, initiate NIV

Murphy et al. JAMA. 2017 Jun 6; 317(21). Struik et al. Thorax. 2014 Sep; 69(9)

# Qualifying Criteria

---

- BIPAP-S
  - ABG with PaCO<sub>2</sub> ≥52 AND,
  - Overnight oxygen desaturation ≤88% on 2 lit oxygen or on patient's prescribed supplemental oxygen (whichever is higher), for > 5 minutes, AND
  - OSA is considered and ruled out (Sleep study not required)
- BIPAP-ST/VAPS
  - PaCO<sub>2</sub> ≥7 mmHg from baseline, AND persistent overnight desaturation despite use of BIPAP-S, for at least 2 months, average 4 hours per night.
- HMV
  - Persistent Hypercapnia despite highest BIPAP-ST support (IPAP >25 CMW)
  - Significant dyssynchrony (shorter insp time, adjust rise time)
  - Increased oxygen requirement (more than 40% FiO<sub>2</sub>)
  - Need for daytime support (>10 hrs) or the need of a mouthpiece
  - OR, Documentation of Chronic respiratory failure secondary to COPD

# Take Home Points

---

- In OHS, both CPAP and NIV improve survival, in addition to sleep quality, and daytime symptoms.
- In ambulatory patients with stable OHS and OSA, CPAP is preferred.
- Use NIV if non obstructive OHS or persistent hypoventilation despite CPAP.
- If hospitalized, initiate NIV upon discharge (consider PSG in 3 months)
  
- In ambulatory patients with neuromuscular disease, use of home NIV is associated with improved survival and quality of life metrics.
- If hospitalized, initiate NIV upon discharge (PSG only if failing empiric Rx)
  
- In ambulatory patients with stable hypercapnic COPD, high intensity BIPAP is associated with lower mortality, lower hospital readmissions, and improves measures of quality of life.
- IF hospitalized, reassess 2-4 weeks post discharge, and initiate NIV if persistent hypercapnia despite medical optimization.
